SPECIFICATION

TITLE OF THE INVENTION

BROADCASTING RECEPTION APPARATUS AND METHOD

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is based upon and claims the
5 benefit of priority from the prior Japanese Patent
Application No. 2003-022154, filed January 30, 2003,
the entire contents of which are incorporated herein by
reference.

BACKGROUND OF THE INVENTION

10 1. Field of the Invention

The present invention relates to an improvement in
a broadcasting reception apparatus and method for
receiving, for example, television broadcasting.

2. Description of the Related Art

15 As is well known in the art, a current TV receiver
is such that, by operating a key on a remote
controller, power supply is started and the TV receiver
is turned on.

In this case, the TV receiver is turned on while
20 retaining the last set state in effect immediately
before the power supply was stopped. For example, the
receiver is automatically turned on at the channel
selected immediately before the power supply was
stopped.

25 Where one television receiver is used exclusively
by a single user, it is turned on so as to retain the
last set state each time the power supply is started

and is, therefore, convenient for the user.

On the other hand, where one television receiver is shared by a number of users, it is necessary to re-set it to a desired program each time the power supply is started, inconveniencing each user and thus presenting a problem.

Jpn. Pat. Appln. KOKAI Publication No. 2002-57996 discloses a structure in which a television signal corresponding to a channel desired by the user is automatically selected by broadcasting the television signal with a digital code superimposed thereon and comparing the code with a code previously registered by the viewer in the receiver.

However, in the structure set out in this KOKAI PUBLICATION, because it is necessary to broadcast the television signal with the digital code superimposed thereon, it is difficult to readily achieve the structure in practice.

BRIEF SUMMARY OF THE INVENTION

According to one aspect of the present invention, there is provided a broadcasting reception apparatus comprising: an input section configured to receive a password; a registration section configured to allow a plurality of such passwords to be registered; a broadcasting reception section configured to have its starting controlled on the basis of a result of comparison between the password registered in the

registration section and any password input through the
input section; a storage section configured to gain
information relating to a reception history with the
broadcasting reception section in a started state; and
5 a control section configured to control setting
contents, at a starting time of the broadcasting
reception section, on the basis of the information
relating to the reception history stored in the storage
section.

10 According to one aspect of the present invention,
there is provided a broadcasting reception method using
a broadcasting reception section comprising a channel
selection section configured to receive broadcasting
and select a signal of a predetermined channel, and a
15 signal processing section configured to apply
predetermined signal processing to the signal selected
at the channel selection section, comprising:
registering a password; inputting any password;
controlling a starting of the broadcasting reception
20 section on the basis of a result of comparison between
the input password and the registered password;
obtaining information relating to a reception history
with the broadcasting reception section in a started
state and storing the information in such a way as to
25 correspond to the password; and controlling setting
content at the starting time of the broadcasting
reception section on the basis of the stored reception

history.

BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING

The accompanying drawings, which are incorporated
in and constitute a part of the specification,
5 illustrate embodiments of the invention, and together
with the general description given above and the
detailed description of the embodiments given below,
serve to explain the principles of the invention.

FIG. 1 is a block diagram showing an embodiment of
10 the present invention which is used in explaining
a television reception apparatus;

FIG. 2 is a view for explaining one example of
operation keys on a remote controller in the
embodiment;

15 FIG. 3 is a flowchart for use in explaining one
portion of a mode setting operation in the embodiment;

FIG. 4 is a flowchart for use in explaining the
remaining portion of the mode setting operation in the
present embodiment;

20 FIG. 5 is a flowchart for use in explaining the
operation of a mode-set TV reception apparatus
according to the embodiment of the present invention;

FIG. 6 is a flowchart for use in explaining the
operation of a mode-set TV reception apparatus
25 according to the embodiment of the present invention;

FIG. 7 is a flowchart for use in explaining
a set-content modifying operation in the embodiment of

the present invention; and

FIG. 8 is a flowchart for use in explaining a set-content modifying operation in the embodiment of the present invention.

5

DETAILED DESCRIPTION OF THE INVENTION

One embodiment of the present invention will be explained in more detail below with reference to the accompanying drawing. FIG. 1 shows a television receiver as explained in connection with this
10 embodiment. This television receiver is generally classified into a standby block 11 and a reception block 12.

Of these blocks, the standby block 11 is normally supplied with electric power from a power supply
15 through a plug 13 and is set to a starting state. The reception block 12, on the other hand, is such that only when a power supply switch 14 is closed is it supplied with the electric power from the power supply through the plug 13.

20

Here, the standby block 11 comprises a receiving section 16 for receiving operation information which is transmitted by means of light from a remote controller 15, a microcomputer 17 for allowing the operation information which has been received at the receiving
25 section 16 to be analyzed and outputting a corresponding control signal, and a timer 18 for measuring the time involved.

When a power supply key on the remote controller 15 is operated, the microcomputer receives corresponding operation information via the receiving section 16 to close the power supply switch 14.

5 The reception block 12 is equipped with a central processing unit (CPU) 19. The CPU 19 is so configured as to receive a control signal from the microcomputer 17 in the standby block 11 as well as time information measured by the timer 18.

10 The CPU 19 generally controls the reception block 12 in such a manner as to allow a program which has been recorded in compressed form in a nonvolatile memory 20 to be output according to a program in a main memory 21, that is, also with the use of time
15 information, etc., as required, to be output with a control signal from the microcomputer 17 in such a manner as to reflect the user's operation.

 That is, a TV signal which has been received by an antenna 22 is supplied to a tuner section 23 where
20 a video signal and audio signal of a desired channel are selected. The video and audio signals thus selected in the tuner section 23 are supplied via the CPU 19 to a signal processing unit 24 where they are demodulated.

25 The video signal thus demodulated in the signal processing section 24 is supplied to a monitor 25 for video display, while, on the other hand, the audio

signal thus demodulated in the signal processing section 24 is fed to a speaker 26 for speech reproduction.

FIG. 2 shows one example of operation keys on the remote controller 15, that is, the above-mentioned power supply key 15a, an input changeover key 15b, numeric keys 15c numbered 1 through 12, set menu key 15d, up/down keys 15e for reception channel, and volume up/down keys 15f.

Here, this TV receiver can be set to either a common mode available to any non-specific user or a personal mode accessible by an input operation of a password by a registered specific user only or to both modes.

For the common mode and personal mode, a database is provided with their set mode contents stored in it. For the personal mode, in particular, a database is provided with its stored content set for each registered user. The data involved is stored in the nonvolatile memory 20.

As the set contents, for example, there are various items such as a history of view channels (selected channel numbers, view start/end time, view start/end week days, etc.), a parental lock level, various kinds of parameters for volume control, various kinds of parameters for video adjustment, and so on. These are automatically stored in a database for each

variation involved.

It is to be noted that, when the power supply switch 14 is changed over from closed to open, the changed-over time is set to a view end time and view
5 end week day. Further, when the power supply switch 14, being closed, is placed in the power off state by forcibly removing the plug 13 from the associated outlet, the next time the power is supplied to the reception block 12 a view end time and view end week
10 day are set.

Here, FIGS. 3 and 4 show a combined operation flowchart for setting the television receiver to a common mode, personal mode or both modes. This mode setting operation is realized in the case where, with
15 a power supply switch 14 of a newly bought TV receiver being initially closed, a menu screen is displayed on a monitor 25 for allowing the user to effect a mode setting at each insertion of a plug 14 into an associated outlet, and so on.

20 First, when a mode setting is started at step S1, the CPU 19 allows a message indicating "Register in personal mode?" to be displayed on the monitor 25 at step S2. At step S3, a wait is made for YES/NO decision in this connection and, at step S4, either YES
25 or NO is decided as being input.

In this case, for example, YES information is input in the case of the personal registration by

operating an input changeover key 15b on the remote
controller 15 and then operating the channel up
key 15e. On the other hand, NO information is input by
operating the input changeover key 15b and operating
5 the channel down key 15e.

In the case where NO is decided for personal
registration at step S4, then the CPU 19 automatically
sets the TV receiver to a common mode at step S5 and
ends the mode setting operation.

10 In the case where YES is decided for personal
registration at step S4, the CPU 19 sets a wait state
for any password of a prescribed number of characters
at step S6 and decision is made whether or not an input
password is duplicated as being already registered one
15 at step S7.

If decision is made that the input password is
duplicated (YES) at step S7, the CPU 19 allows a
message indicating "Cannot be registered" to be
displayed on the monitor 25 at step S8 and the process
20 goes to step S6.

If decision is made that, at step S7, the password
is not duplicated (NO), the CPU 19 allows the input
password to be recorded on the nonvolatile memory 20 at
step S9 and, here, a personal registration is ended.

25 Further, the CPU 19 allows a message
indicating "Allow starting of receiver in common mode?"
to be displayed on the monitor 25 at step S10 and, at

step S11, sets a wait state in which such an input is allowed or not allowed. And the CPU allows a result of inputting to be stored in the nonvolatile memory 20 at step S12.

5 If, in this case, an "allowed" input is received, both the personal mode and common mode are set by the CPU 19. If, on the other hand, a "not allowed" input is set, then only a personal mode is set by the CPU 19.

 After this, the CPU 19 allows a message
10 indicating "Allow addition of personal registration when common mode is started?" to be displayed on the monitor 25 at step S13. And a wait state is made as to whether "Allow" or "Do not allow" is input (step S14). At step S15, a result of inputting is recorded on the
15 nonvolatile memory 20 and a mode setting operation is ended at step S16.

 FIGS. 5 and 6 show a combined operation flowchart of the TV receiver to which the above-mentioned mode setting is effected. First, starting is made at step
20 S17 and the microcomputer 17 waits for any keys on the remote controller 15 to be operated at step S18. If decision is made that any keys are operated (YES), the power supply switch 14 is so controlled as to be turned ON.

25 Then, electric power from the power supply is fed to the reception block 12 and the CPU 19 decides whether or not any numeric keys 15c are operated at

step S19. If YES, the CPU 19 decides whether or not the input numbers reach any prescribed digit number at S20. If the answer is NO, then at step S21 the input numbers are stored in the main memory 21 and the process is transferred to step S18.

In the case where the numbers input at step S20 reach a prescribed digit number (YES), the CPU 19 decides whether or not the input numbers are matched to any password registered on the nonvolatile memory 20 at step S22. If NO, the input numbers are deleted from the main memory 21 at step S23 and the CPU 17 allows the power supply switch 14 to be opened through the microcomputer 17 and the process is transferred to step S18.

If, at step S22, the input numbers are decided as being matched to any registered password (YES), the CPU 19 allows the set content to be read out from a corresponding database in the nonvolatile memory 20 and allows the read-out data to be stored in the main memory 21 at step S24.

In the case where any numeric keys 15c are decided as not being operated (NO) at step S19, the CPU 19 decides whether or not any power supply key 15a is operated at step S25. If NO, the numbers input at step S26 are deleted from the main memory 21 and, after the power supply switch 14 has been opened through the microcomputer 17, the process is transferred to

step 18.

In the case where it is decided that the power supply key 15a is operated (YES) at step S25, the CPU 19 reads out information of "whether or not to allow starting in common mode" from the nonvolatile memory 20 at step S27 and decides whether or not the starting is allowed in the common mode at step S28.

If the starting is decided as not being allowed (NO), the CPU 19 allows this "not allowed" information to be displayed on the monitor 25 and the process is transferred to step S26. If, on the other hand, this is decided as being allowed (YES), the CPU 19 reads out a set content from a corresponding database of the nonvolatile memory 20 and allows the read-out data to be stored in the main memory 21 at step S29.

Here, after steps S24 or S29, the CPU 19 automatically decides any selecting channel from the view history of the set contents stored in the main memory 21 at step S30 and, at step S31, allows a corresponding channel to be selected at the tuner section 23. After this, the CPU 19 restores various kinds of setting on the basis of the set contents stored in the main memory 21 at step S32 and the process is ended at step S33.

According to the above-mentioned embodiment, with respect to a plurality of registered users, their set content accumulated database is prepared and, for the

user whose password is matched, the various kinds of setting can be done based on the set contents read out from the corresponding database.

5 For this reason, with respect to a plurality of users, the receiver can be easily started, in a simpler structure, with their corresponding set contents. From the view history stored for each registered user, for example, channel selection can be automatically made at a starting time of a receiver under a highly frequently
10 viewing channel.

Further it is possible for those registered users to obtain an image display and voice reproduction corresponding to their own setting contents simply by operating the numeric keys 15c on the remote controller
15 15 and inputting their own passwords.. It is, therefore, not necessary to operate the power supply key 15a and this insures easier handling.

Further, when the common mode is "allowed", the power supply key 15c is normally operated and, in this
20 way, various kinds of setting can be effected based on the set contents read out from the database corresponding to the common mode. It is also possible for those not-registered users to easily use this setting.

25 Further, the television receiver according to the embodiment above may be normally of an installed type, but it may be of a portable compact type such as

a so-called mobile type. Since, in particular, the mobile TV receiver tends to be utilized on his or her own use, if setting is made not to be allowed in the common mode, then it is possible for the user to
5 effectively use it under a highly secure environment.

FIGS. 7 and 8 show a combined operation flowchart for modifying setting contents. The modification of the setting contents is started (step S34) by operating the setting menu key 15d of the remote controller 15.

10 Then the CPU 19 decides whether or not starting is made in a personal mode at step S35. If it is decided that the starting is made in the personal mode (YES), all the setting menu is displayed on the monitor 25 at step S36 and, at step S37, it is decided whether or not
15 any addition of a personal registration is selected.

If it is decided that the starting is not made in the personal mode (NO) at step S35, the CPU 19 decides whether or not any personal registration is allowed in the common mode at step S38 and, if YES, the process is
20 transferred to step S37.

If it is decided that any personal registration is not allowed in the common mode (NO) at step S38, the CPU 19 displays the set menu other than that of the personal registration on the monitor 25 at step S39 and
25 the process is transferred to step S37.

In the case where any addition of the personal registration is decided as being selected (YES) at

step S37 above, the CPU 19 receives the incoming password of a prescribed number of characters at step S40 and, at step S41, allows the input contents to be stored in the nonvolatile memory 20 and ends the processing at step S42.

In the case where, at step S37, any addition of the personal registration is decided as not being selected (NO), the CPU 19 decides whether or not the "allowing" of a starting in the common mode is selected at step S43. If YES, the CPU 19 waits for the receipt of an "allowed" or "not allowed" input at step S44 and the process is transferred to step S41.

In the case where, at step S43 above, the "allowing" of a starting in the common mode is decided as not being selected (NO), the CPU 19 decides whether or not the "allowing" of any personal registration is selected at step S45. If NO, the process is transferred to step S37.

If YES, the CPU 19 waits for the receipt of an "allowed" or "not allowed" input at step S46 and the process is transferred to step S41.

The present invention is not restricted to the above-mentioned embodiment and various changes or modifications of the present invention can be made without departing from the essence in practice. Further, by properly combining a plurality of constituent elements of the above-mentioned embodiment,

it is possible to achieve the above-mentioned invention. For example, any several constituent elements may be properly eliminated from the remaining portion of the present invention.

5 Additional advantages and modifications will readily occur to those skilled in the art. Therefore, the invention in its broader aspects is not limited to the specific details and representative embodiments shown and described herein. Accordingly, various
10 modifications may be made without departing from the spirit or scope of the general inventive concept as defined by the appended claims and their equivalents.
